(54) IMPROVEMENTS IN AND RELATING TO TABLETS

(71) We, SOLCO BASEL AG, a Swiss Company of 18 Gellertstrasse, Basel, Switzerland, do hereby declare the invention for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the following statement:—

Background and Brief Summary of the Invention

The invention relates to a process for the manufacture of a multi-zone tablet, and to a tablet manufactured by this process.

The zones can be irregularly formed, but can also be regularly formed, for example as layers. In this way a multi-layered tablet is formed.

Multilayered tablets serve, among other things, to keep different active ingredients separate from each other in one and the same preparation by accommodating them in different layers and then administer them together in a predetermined ratio of doses. In many cases, one or more of the active ingredients is required to have a retarded 25 action. The problem of the present invention is to provide a process and a tablet of the kind defined above such that with the least possible production costs a tablet is obtained whose active ingredients having a retarded 30 action can be administered orally together with active ingredients having an instant action in human medicine.

The process of the invention is characterized in that a non-plastic tablet mass and a plastic chewing gum mass, whereby one of the said masses contains at least one pharmaceutically active ingredient, are introduced into tablet mould and with a fitting force plug are compressed to form a joint tablet, having at least one hard zone comprising the tablet mass and at least one plastic zone comprising the chewing gum mass.

The chewing gum mass contains a waterstable portion which, although it can be kneaded in the mouth it cannot be dissolved.

The pharmaceutical active ingredients to be administered with an immediate action are mixed with the tablet mass and are very

rapidly liberated in the mouth if the hard layer comprising this tablet mass is bitten and/or sucked, whereby it is dissolved. The pharmaceutical active ingredients to be administered with a retarded action are mixed with the plastic chewing gum and are released only slowly during the actual chewing. In this way a very uniform supply of the active ingredients over a long period can be obtained. Active ingredients which are difficult or impossible to incorporate homogeneously in a tablet mass due to their oily or otherwise difficult consistency can also be mixed with the plastic mass and moreover can be very uniformly distributed in it. Active ingredients which are too volatile to be satisfactorily incorporated in tablet masses can also be incorporated in the plastic mass since it considerably reduces their volatility.

In addition to the pharmaceutical active ingredients flavouring agents or similar substances can be admixed.

It is for this reason that so-called chewing gum and the like, which consist of a core of plastic mass covered with a coating has previously been produced by the process used for producing coating pills. However, the process according to the invention is considerably simpler than the production process for coating pills, because it can be performed on conventional pelletizing machines for multilayered tablets, whereby it is merely necessary for the feed and press tools for the tablet mass of one or more tablets layers to be replaced by corresponding tools for processing portions of plastic chewing gum mass.

The tablet mass is generally present in powder or granulate form and the conventional pelletizing machines are designed for the processing thereof. It is therefore recommended to proceed correspondingly when producing the plastic layer and this is preferably carried out by hardening the chewing gum mass by cooling so that it becomes granulatable and is then granulated, whereby as a granulate it is pressed to form the plastic portion of the tablet.

In certain circumstances the granulated, greatly cooled chewing gum mass is not

50

55

. KN .

65

70

75

80.

85

90

pelletizable and it is then recommended to make the said mass pelletizable by heating, whereby when heated it is kept flowable by mixing with non-toxic lubricant powder. It is then introduced into the tablet mould as a pelletizable, flowable, granulated chewing gum mass and pressed.

The plastic and non-plastic mass can be joined together in various ways. A preferred process which is particularly simple to perform, comprises mixing the chewing gum granulate with flowable, non plastic tablet mass, followed by pelletizing. The individual granulate particles then form the zones or several granulate particles of the same mass, which are contiguous with one another, form a common zone,

Another possibility of combining the different masses comprises the pelletization of the individually coated tablet mass and chewing gum mass.

A further possibility of joining the two masses comprises punching the chewing gum mass as a disc from a preformed strip and 25 pressing with the tablet mass to a tablet.

A preformed form strip of plastic mass can be easily obtained by rolling. No difficulties are encountered in punching out the disc from such a strip.

The special adhesiveness of the plastic mass and its ability to seal off one substance from another are in many cases advantageous, particularly if two layers of tablets are required to be sealed off from each other or if it is required to increase the resistance of the tablet to breakage. In such a case, the element of plastic mass is inserted as a middle layer. It then seals the two adjacent layers of tablet mass from each other and functions as elastic supporting layer to increase the resistance of the whole tablet to breakage.

Such a sealing layer also enables two chemically incompatible pharmaceutical compositions to be accommodated in one and the same tablet. In that case, one layer of the tablet mass is mixed with the first pharmaceutical composition and the second layer with the second composition so that these chemically incompatible substances are separated from each other by the middle layer. One and the same multilayered tablet may also contain a plurality of interlayered or over-layerer plastic elements.

Two chemically incompatible pharmaceutical active ingredients can also be sealed relative to one another by mixing one of the active ingredients into the plastic chewing gum mass and the other into the non-plastic tablet mass.

A further possibility of joining the two masses is brought about by placing the chewing gum mass as a preformed element in a recess of a hard zone pressed from the tablet mass, the recess covering the underside and at least part of the periphery of the said preformed element. Joint pressing to a tablet then takes place.

Brief Description of the Drawings

Other and further objects of the present invention will be apparent from the following description and claims, and are illustrated in the accompanying drawings which by way of illustration show preferred embodiments of the present invention and the principles thereof, and what are now considered to be the best modes contemplated for applying these principles. Other embodiments of the invention embodying the same or equivalent principles may be used and structural changes may be made if desired by those skilled in the art without departing from the invention and the scope of the appended claims.

In the drawings:

Detailed description of the preferred embodi- 125

In Figure 1, the reference numeral 1 indicates a first layer pressed from a non-plastic

90

1,484,832

tablet mass, 2 indicates a layer consisting of a preformed disc of plastic mass and 3 indicates a second layer pressed from non-plastic tablet mass. Mixed in with the tablet mass of layer 1 is a pharmaceutical composition which is incompatible with the pharmaceutical composition in layer 3 because it would decompose on contact with it. Layer 2 which extends over the entire cross-section of the tablet here serves also as separating layer and prevents contact between the two pharmaceutical compositions and hence their decomposition. In Figure 2, the two layers 4 and 5 consist of tablet mass and layer 6 of plastic 15 mass. In Figure 3, the two layers 7 and 8 consist of tablet mass and layer 9 of plastic mass. In Figure 4, layers 10 and 11 consist of tablet mass and layers 12 and 13 of differing plastic masses. The tablet shown in Figure 4 can be manufactured by first producing the tablet half consisting of layers 11 and 13 and then, independently thereof, the tablet half consisting of layers 10 and 12. Both tablets halves can be produced on the same machine since both consist of a layer of tablet mass and a layer of plastic mass. The multilayered tablet shown in Figure 4 is then obtained by joining the two halves together. The various layers of tablet mass and various elements or 30 layers of plastic mass of one and the same tablet may have different substances mixed in with them and/or be differently coloured. The tablets shown in Figures 1 to 4 are rotationally symmetrical in each case about the dash-dot axis indicated in the Figure, in other words they are circular in cross-section. In the tablet shown in Figures 5A and B,

3

the three layers 14, 15 and 16 consist of differing tablet masses. The middle layer 15 is formed to have a conical concentric recess 17 in which a conical preformed element 18 of plastic mass was inserted before layer 14 was pressed on it. The element 18 was placed into the recess 17 as a ball of plastic mass 45 and pressed into the conical form illustrated in the drawing by the tablet mass of the upper layer 14 as this layer was pressed into position.

In the tablet shown in Figures 6A and B, the two layers 19 and 20 consist of differing tablet masses. Layer 19, which is the lowermost layer, is the first to be formed. It is provided with a conical surface 21 and a central recess 22 which does not extend right down to the bottom 23. A preformed element 24 of plastic mass is fitted into this recess 22 before layer 20 is pressed on it, the undersurface 25 of the preformed element and part of its circumference 26 being thereby covered by the layer 19 while part of it protrudes from the recess 22. Layer 20 of sufficient thickness is then pressed on the surface so that element 24 is completely enclosed inside the tablet mass. The two tablets shown in Figures 5A, 5B, 6A and 6B are also axially symmetrical cylinders but the form of the tablets illustrated may be modified, for example they may be given a polygonal crosssection.

The multilayered tablets according to Figure 1 to 6 are axially symmetrical to the particular axis of symmetry 70 to 75, being coated in the direction of the relevant axis of symmetry.

The manufacture of a tablet according to Figure 1 is illustrated in Figure 7 where Figure 7A shows how the tablet mass 30 is dosed in such a quantity that it is just sufficient for layer 1 to fill the mould 31 of the press. Figure 7B shows how in the next step the tablet mass is compressed by a force plug 32 to form layer 1. When this has been done, a disc 2 cut out of a strip 34 of adhesive plastic mass by means of a punch 33 is placed on layer 1. The disc 2 is punched out to have the same circular cross-section as the opening of the die matrix 31, allowing for the necessary tolerances. In the next step shown in Figure 7D, a portion of tablet mass 35 just sufficient for producing layer 3 is poured over layer 1 and 2 which are now placed above one another, and the mass 35 is then compressed by a press 36 to form layer 3 as shown in Figure 7E, and at the same time layers 1, 2 and 3 are bonded together by the pressure applied. The bond between layers 1 and 3 on the one hand and layer 2 on the other is promoted by the adhesiveness of the plastic mass. This enables substantially lower pressures to be applied for pressing with the press 36 than would be necessary for bonding together three layers pressed from powder. The pressure applied by the press 36 should be adjusted so that it is just sufficient to impart the necessary firmness without spreading out the layer 2. The dimensional stability of the preformed layer of plastic mass must be adjusted to the necessary pressure so that the layer will not be forced out of shape. The finished multilayered tablet is then expelled by an ejector stamp 37 as shown in Figure

The method of manufacturing the multilayered tablet shown in Figure 8 is substantially the same as that described with reference to Figure 7 and the various operational steps illustrated in Figure 8 correspond to those illustrated above them in Figure 7. The main difference between the two manufacturing processes is that in the press die 38 which corresponds to the press die 32, the contour of the end face 39 conforms to the desired surface 21 of the layer 19 and that the punch 40 corresponding to the punch 33 cuts a smaller element out of the strip 41 of plastic 125 mass to fit into the recess 22.

According to Figure 9 illustrating the manufacture of a tablet shown in Figures 5A and B, the tablet mass 50 is introduced into the matrix 51 in a measured quantity just 130

75

70

80

90

95

sufficient to form-myer 16. In the next step of the process illustrated in Figure 9B, the tablet mass is compressed by a force plug 52 to form layer 16, and in the next following step layer 16 is ejected by an ejector stamp 61. Layer 16 has thus been produced in the same way as a single layered tablet and may therefore be produced in a conventional pelletizing machine in exactly the same way as single layered tablets. Layer 16 is then transferred to a second pelletizing machine where it is introduced into the die matrix 53. A measured quantity of tablet mass 54 is then poured on it, (Figure 9E) and pressed into the form of layer 15 with conical recess 17, using a force plug 55 having a central conical projection 56. In the next step of the process (Figure 9G) the resulting two layered tablet consisting of layers 16 and 15 is ejected by the ejector stamp 57. The steps of the process illustrated in Figures 9D to 9G may be carried out in a conventional pelletizing machine for single layered tablets provided only that it is equipped with an additional 25 feed mechanism and suitable adjustment of the operating cycle for feeding layer 16 according to Figure 9D. The two layered tablet composed of layers 15 and 16 is then introduced into the die 30 matrix 58 of a third pelletizing machine with the conical recess 17 facing upwards. In the next phase of the cycle, element 18 is placed in this recess. The element 18 is spherical at this stage and for ease of handling it is covered with a layer of gelatine not shown in the drawing. The element 18 in recess 17 has exactly the same total volume as recess 17. In the next stage of the process, a measured quantity of tablet mass for layer 14 40 is introduced, and in the next following step (Figure 9K) this mass is compressed to form layer 14, using a force plug 59 with smooth end face. Since element 18 is of a kneadable consistency and easily deformed, it is pressed 45 by this operation into the recess 17 so that it now completely fills the recess, as shown in Figure 9K. When this step of the process has been completed, the now finished multilayered tablet is removed from the machine 50 by an ejector stamp 60 as shown in Figure 9L. Steps H to L may also be carried out in a conventional pelletizing machine for single layered tablets if two additional feed mechanisms, namely one for the two-layered tablet 55 composed of layers 15 and 16 as shown in Figure 9H and one for supplying the element 18 shown in Figure 1 are arranged in the front of the feed mechanism for the tablet mass according to Figure 9J. The pressing process illustrated in Figures 7B, 8B, 9B and 9F is carried out at sufficiently high intensity

to produce layers with sufficient hardness for further treatment. The press operation illustrated in Figures 7E, 8E and 9K, in other

65 words the last press operation, is carried out

at a higher intensity so that the total tablet will be strong enough for use.

Elements 24, 2, 6, 9, and 13 which also consist of plastic mass may also be covered with non-sticky or sealing material such as gelatine in the same way as element 18 before they are embedded in the substance of the tablet. Gelatine seals the ethereal oils of chewing gum from the remaining tablet substance in the finished tablet and facilitates mechanical handling of the element of plastic mass before it is inserted in the tablet sub-

Before the elements of plastic mass are inserted in the tablet, they are easiest to handle mechanically if they are round, for example if they are spherical or ellipsoidal, and the round form shown in Figure 9 is therefore preferably used as the starting form for the elements of plastic mass.

The tablets may also be manufactured in two successive pelletizing machines according to Figures 7 and 8 in the same way as described with reference to Figure 9. In this case, steps A and B are carried out in the first pelletizing machine and steps C to F in the following pelletizing machine. Alternatively, a pelletizing machine may be equipped to carry out all steps of the process illustrated in Figures 7 to 9. Figure 12 shows such a machine equipped for the stages shown in Figures 7 and 8.

According to Figure 10 for manufacturing a multilayered tablet according to Figure sufficient of tablet mass 80 for the layer 1 is 100 introduced into mould 81 (Figure 10A) and then compressed with punch die 82 to form layer 1 (Figure 10B). Sufficient granulated plastic mass 83 is then introduced to form layer 2. This granulated plastic mass is then 105 mixed in a mixer 84, from where it passes to a cooling device 85 where, in a continuous process, it is cooled to a temperature at which the plastic mass is no longer plastic, but is instead breakable and therefore granulated. This cooled plastic mass passes into the grinding apparatus 86 where it is granulated. As indicated by dotted line 87 the grinding apparatus 86 is cooled by the cooling device. In the same way and as indicated by dotted 115 line 88 mould 81 can be cooled.

From grinding apparatus 86 the mass passes into a heatable mixing apparatus 107 and from there the now pelletizable plastic mass passes in the form of a flowable granulate into mould 81 (Figure 10C) where it is compressed to form layer 2, being simultaneously connected with layer 1 by pressing (Figure 10D). Then tablet mass 89 for layer 3 is introduced (Figure 10E) and compressed to give layer 3 (Figure 10F) and is simultaneously bonded to layer 2. Finally the finished three-layered tablet of Figure 10G is discharged.

1,484,832

5

For granulation purposes the chewing gum mass is cooled until it is granulated. The appropriate temperature for granulation varies from one chewing gum mass to the next, but is in the range -20 to +10°C. The granulate of the plastic chewing gum mass is heated to about 18°C in the heatable mixing apparatus 107 to make it easily pelletizable. If the chewing gum granulate is cooler it cannt be pelletized so well. In certain circumstances, however, the chewing gum granulate at 18°C is sticky and consequently not sufficiently flowable, hence it is coated with a lubricant. Suitable lubricants 15 are e.g. pulverized stearic acid, pulverized hardened castor oil, pulverized polyglycol, pulverized tallow, pulverized paraffin whose melting point is 50 to 52°C, pulverized metal layer weighs 0.5 g. soaps as magnesium stearate or a mixture of several of these substances. An adding device 90 according to Figure 10 is used for adding these lubricants and passes a metered portion of lubricant into mixing apparatus 107 where it is mixed with the granulate formed. According to Figure 11 plastic chewing gum mass is mixed into mixer 94, from where it passes to a cooling device 95 where it is cooled in a continuous process to -10° C. The cooled and consequently no longer plastic 30 mass, which has become breakable and therefor granulatable, is passed into grinding apparatus 96, where it is granulated. The granulate passes into the heated mixing apparatus 97 where it is heated to 18°C and 35 mixed with lubricants from adding device 100. On leaving mixer 97 the chewgum granulate is flowable and pelletizable and passes into a mixer 98. Reference numeral 99 designates a store for non-plastic tablet mass in block form, granulated in grinding apparatus 101. The tablet mass granulate from grinding apparatus 101 also passes into mixer 98. The two granulates are mixed in mixer 98 and pass portionwise 45 into mould 102. Punch die 104 presses each portion of granulate 103 into a multi zone tablet 105 (Figure 11B), which is then discharged according to Figure 11C. Figure 12 shows a top plan view of a press drum 47 having a total of 17 cylindrical press matrices corresponding to matrix 31 uniformly distributed over its circumference. The drum rotates stepwise at angular intervals from one matrix to the next in the direction of the arrow so that the matrices successively enter into the range of action of different tools. They first come under the action of a filling tool 48 by which they are filled with material according to Figure 7A or 8A, tains: then under the action of the press tool 42 for pressing according to Figure 7B or 8B, then

under the action of a punching tool 43 which

contains a reserve of strips of plastic mass

for carrying out the interlayering operation

according to Figure 7C or 8C, then under the

action of a feed tool 44 for supplying the tablet mass according to Figure 7D or 8D, then under the action of a press tool 45 for carrying out the pressing operation according to Figure 7E or 8E and finally under the action of a ejector tool 46 for ejection according to Figure 7F or 8F. The multilayered tablets shown in Figures 5

1 to 6 may in addition be provided with a covering (not shown).

Some examples illustrating the chemical composition of multilayered tablets according to the invention will now be given. In all these examples the pressure exerted during tablet manufacture is 1000 kg/cm² and the finished tablet weight is 1.5 g. In the threelayered tablets of the following examples each

Example 1 In a three-layered tablet according to

Figure 1 the middle layer 2 of plastic mass contains the following constituents: 1.75 parts by weight of chicle gum, 0.5 parts by weight of paraffin, wax, 0.06 parts by weight of tolu balsam, 90 0.03 parts by weight of Peru balsam,

0.03 parts by weight of alum, the outer hard layer 1 of the tablet mass con-

99.0 parts by weight of grape sugar and part by weight of the active ingredient auinine: all the other outer hard layer 3 of the tablet mass contains:

98.0 parts by weight of grape sugar and 100 parts by weight of the flavouring agent caramel.

This multilayered tablet is an anti-smoking tablet in which the plastic layer can be chewed as chewing gum long after the tablet 105 has been taken in by the mouth while the alum in the tablet stimulates the flow of saliva which, as has been found by experience, reduces the craving for smoking.

Example 2 110 In a three-layered tablet according to Figure 1 the middle layer 2 of plastic mass contains the following constituents:

1.70 parts by weight of chicle gum, 0.5 parts by weight of sugar 115 0.5 parts by weight of paraffin, wax, 0.06 parts by weight of tolu balsam, 0.03 parts by weight of ipecacuanha, 0.03 parts by weight of eucalyptus; one outer hard layer 1 of the tablet mass con- 120

50.0 parts by weight of grape sugar, parts by weight of sorbitol and 48.0 part by weight of the active ingredient fennel oil: 125

and the other outer layer 3 of the tablet mass contains:

This multilayered tablet is an antitussive in which the plastic layer continuers to be able to be chewed as chewing gum long after the tablet has been taken in by mouth while the ipecacuanha and eucalyptus, as is well known, reduce coughing. Example 3 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.80 parts by weight of chicle gum, 0.15 parts by weight of grape sugar and 1 part by weight of sugar, 0.02 parts by weight of grape sugar and 1 part by weight of parts by weight of chicle gum, 0.10 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of fucle gum, 0.75 parts by weight of grape sugar and 1 part by weight of a cuclyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of fucle gum, 0.75 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.01 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of paraffin wax, under the plastic mass instead of 0.03 parts by weight of pecacuanha, and 0.03 parts by weight of eucalyptus. Example 6 Plastic mass consisting of: 1.75 parts by weight of fuclic gum, 0.03 parts by weight of paraffin wax, 0.06 parts by weight of fuclic gum, 0.09 parts by weight of paraffin wax, 0.009 parts by weight of paraffin wax, 0.009 parts by weight of paraffin wax, 0.009 parts by weight of chicle gum, 0.009 parts by weight of paraffin wax, 0.009 parts by weight of paraffin wax, which serves as a lubricant. The granulate is kept dry and heared to +18°C. The granulate is then mixed with 0.02 parts by weight of chicle gum, 0.09 parts by weight of chi				
5 1.0 part by weight of the active ingredient femed oil. This multilayered tablet is an antiussive in which the plastic layer continues to be able to be chewed as chewing gum long after the tablet has been taken in by mouth while the ipseacuanha and eucalyptus, as is well known, reduce coughing. Example 3 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.50 parts by weight of chicle gum, 0.15 parts by weight of partifin wax, 0.01 parts by weight of partifin wax, 0.01 parts by weight of partifin wax, 0.01 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of partifin wax, 0.01 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of partifin wax, 0.01 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of partifin wax, 0.03 parts by weight of partifin wax, 0.04 parts by weight of partifin way, 0.06 parts by weight of partifin way, 0.06 parts by weight of partifin way, 0.07 parts by weight of partifin way, 0.08 parts by weight of Partifin way, 0.09 parts by weight of partifin way, 0.00 parts by weight of partifin way, 0.01 parts by weight of partifin way, 0.02 parts by weight of partifin way, 0.03 parts by weight of partifin way, 0.04 parts by weight of partifin way, 0.05 parts by weight of partifin way, 0.06 parts by weight of partifin way, 0.07 parts by weight of partifin way, 0.08 parts		48.0 parts by weight of sorbitol, 1.0 part by weight of the active ingre-	each case 0.02 parts by weight of paraffin wax,	
dient femel oil. This multilayered tablet is an antitussive in which the plastic layer continues to be able to be chewed as chewing gum long after the ipeacuanha and encalyptus, as is well known, reduce coughing. Example 3 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.20 parts by weight of chicle gum, 0.15 parts by weight of paraffin wax, 0.01 parts by weight of encalyptus. Example 4 Similar to Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of sugar, 0.01 parts by weight of incavally to the sample 2. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of sugar, 0.07 parts by weight of sugar, 0.20 parts by weight of sugar, 0.30 parts by weight of sugar, 0.30 parts by weight of paraffin wax, 0.30 parts by weight of injecacuanha, 0.01 parts by weight of encalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of paraffin wax on the plastic mass instead of 0.03 parts by weight of injecacuanha and 0.03 parts by weight of encalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of paraffin wax, 0.04 parts by weight of encalyptus. Example 6 Plastic mass consisting of: 1.75 parts by weight of fucile gum, 0.48 parts by weight of Flore balsam and 0.03 parts by weight of Flore balsam and 0.03 parts by weight of Peru balsam and 0.03 parts by weight of reading wax, which serves as a labricant. The granulate is kept dry and heard to +18°C. The granulate is then mixed with 0.02 parts by weight of paraffin wax, which serves as a labricant. The granulate is part of paraffin wax, on the paraffin wax on the part of paraffin wax on the paraffin wax on the paraffin wax on	5		Example 12	
tablet has been taken in by mouth while the ipercauanha and eucalyptus, as is well known, reduce coughing. Example 3 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.80 parts by weight of sugar, 0.01 parts by weight of sugar, 0.02 parts by weight of paraffin wax, 0.01 parts by weight of paraffin wax, 0.01 parts by weight of paraffin wax, 0.01 parts by weight of paraffin wax, 0.02 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.04 parts by weight of paraffin wax, 0.05 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.07 parts by weight of paraffin wax, 0.08 parts by weight of paraffin wax, 0.09 parts by weight of paraffi		dient fennel oil. This multilayered tablet is an antitussive in which the plastic layer continues to be able	Flowable and pelletizable granulate formed from the plastic chewing gum mass, produced according to Example 6 is mixed in a weight	65
1.5 mass composed of the following constituents: 1.80 parts by weight of sugar, 0.02 parts by weight of tofu balsam, 0.01 parts by weight of tofu balsam, 0.01 parts by weight of tofu balsam, 0.01 parts by weight of ecacuanha, 0.01 parts by weight of ecacyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of chicle gum, 0.75 parts by weight of chicle gum, 0.01 parts by weight of but balsam, 0.01 parts by weight of chicle gum, 0.02 parts by weight of paraffin wax, 0.03 parts by weight of ecacuanha, 0.01 parts by weight of ecacuanha, 0.01 parts by weight of ecacuanha, 0.02 parts by weight of ecacuanha, 0.03 parts by weight of ecacuanha and 0.03 parts by weight of paraffin wax, In this case, the narcotine incorporated to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of ecacuanha and 0.03 parts by weight of hare a mixed with the flowable non-plastic tablet mass and then pelletized. Example 6 Plastic mass consisting of: 1.75 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.06 parts by weight of experimental transportation of the tablet. Example 6 Plastic mass consisting of: 1.75 parts by weight of experimental paramaceutical anulti-zone tablet, wherein a non-plastic tablet mass and a plastic chewing gum mass, at least one of the said tablet has at least one of the said tablet mass and at plastic chewing gum mass, at least one of the said tablet has at least one plastic chewing gum mass at least one of the said tablet has at least one plastic chewing gum mass at least one of the said tablet has at least one plastic chewing gum mass at least one of the said tablet has at least one plastic chewing gum mass is hardened and at least one plastic chewing gum mass is hardened and made granulated by cooling, is then granulated and pressed as the granulate to form the plastic mould as a pelletizable, with the flowable propelastic chewing gum mas	10	tablet has been taken in by mouth while the ipecacuanha and eucalyptus, as is well known, reduce coughing. Example 3	mass. This tablet mass consists of 99 parts by weight of grape sugar and 1 part by weight of quinine. The mixed granulate is pelletized in a pelletizing mould to give multi-zone	70
1.80 parts by weight of suigar, 0.02 parts by weight of paraffin wax, 0.01 parts by weight of tolu balsam, 0.01 parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of folicle gum, 0.75 parts by weight of paraffin wax, 0.03 parts by weight of peacuanha, 0.01 parts by weight of peacuanha, 0.01 parts by weight of peacuanha, 0.02 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of paraffin wax, 0.01 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of incorotine are mixed into the plastic mass intended of 0.03 parts by weight of eucalyptus. This tablet is again an antitussive, In this case, the narcotine incorporoted to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of ficicle gum, 0.84 parts by weight of folicle gum, 0.95 parts by weight of eucalyptus. Example 6 Plastic mass consisting of: 1.75 parts by weight of sugar and an antitussive, In this case, the narcotine incorporated to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of sugar and the chewing gum gum gum gum gum gum gum gum gum gu		Similar to Example 2 but with a plastic	WITAT WILL OF ATM TO	
0.01 parts by weight of ipecacuanha, only parts by weight of eucalyptus. Example 4 Similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of chicle gum, 0.75 parts by weight of for noir balsam, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of paraffin wax, one coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.05 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.07 parts by weight of paraffin wax, 0.08 parts by weight of paraffin wax, 0.09 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.07 parts by weight of paraffin wax, 0.08 parts by weight of paraffin wax, 0.09 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.07 parts by weight of paraffin wax, 0.08 parts by weight of paraffin wax, 0.09 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.06 parts by weight of paraffin wax, 0.07 parts by weight of paraffin wax, 0.08 parts by weight of paraffin wax, 0.09 parts by weig	15	1.80 parts by weight of chicle gum, 0.15 parts by weight of sugar, 0.02 parts by weight of paraffin wax,	1. A process for the manufacture of a pharmaceutical multi-zone tablet, wherein a non-plastic tablet mass and a plastic chewing	75
similar to Example 2 but with a plastic mass composed of the following constituents: 1.00 parts by weight of chicle gum, 0.75 parts by weight of tolu balsam, 0.01 parts by weight of inecacuanha, only parts by weight of tolu balsam, 0.01 parts by weight of inecacuanha, only parts by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of eucalyprus. In this case, the narcotine incorporoted to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of chicle gum, 0.48 parts by weight of chicle gum, 0.48 parts by weight of chicle gum, 0.49 parts by weight of chicle gum, 0.49 parts by weight of educed pure is cooled to -10°C and granulated to a granulate size of 1 to 1.5 mm. The granulate is kept dry and heated to +18°C. The granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to 30—50 microns and thereby coared with solid paraffin wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coaring is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum mass and the underside and at least cone plastic zone comprising the tablet mass and at least one plastic zone comprising the bardened and made granulate by cooling, is then granulate and the chewing gum mass is made granulated to form the plastic portion of the tablet. 3. A process according to claim 2, wherein the chewing gum mass, where it is pressed. 4. A process according to claim 2, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then pelletized. 5. A process according to claim 1, wherein the trablet mass and then pelletized. 6. A process according to claim 1, wherein the tablet mass and then pelletized. 7. A process according to claim 1, wherein the tablet mass and then pelletized. 8	20	0.01 parts by weight of ipecacuanha, 0.01 parts by weight of eucalyptus.	taining a pharmaceutical active ingredient, are introduced into a tablet mould and are pressed into a joint tablet with an appropriate punch	80
least one plastic zone comprising the chewing gum mass. 25 1.00 parts by weight of sugar, 0.20 parts by weight of paraffin wax, o.01 parts by weight of ipecacuanha, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of paraffin wax on that are a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of chicle gum, 0.48 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, o.06 parts by weight of paraffin wax, o.073 parts by weight of paraffin wax, o.08 parts by weight of paraffin wax, o.09 parts by weight of paraffin wax, oraninuted to a granulate iz then mixed with 0.02 parts by weight of paraffin wax, oraninuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax, oraninuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax, oraninuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax, oraninuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax coating is pelletized. Examples 7 to 11 As in Example 6, but using the plastic annulated and pressed as the granulate to form the plastic portion of the tablet. 2. A process according to claim 2, wherein the chewing gum mass, where it is pressed. 4. A process according to claim 3, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then pelletized. 5. A process according to claim 3, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then pelletized. 6. A process according to claim 1, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then to the process according to claim 1, w				
0.75 parts by weight of sugar, 0.20 parts by weight of paraffin wax, 0.03 parts by weight of ipecacanaha, 0.01 parts by weight of ipecacanaha, 0.01 parts by weight of eucalyprus. Example 5 Similar to Example 2 except that 0.03 parts by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of eucalyprus. This tablet is again an antitussive. In this case, the narcotine incorporoted to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of chicle gum, 0.48 parts by weight of paraffin wax, 0.06 parts by weight of Peru balsam and 0.03 parts by weight of paraffin wax, 0.06 parts by weight of alum; is cooled to -10°C and granulated to a granulate size of 1 to 1.5 mm. The granulate is kept dry and heated to +18°C. The granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to a granulate is then mixed with 0.02 parts by weight of paraffin wax contains the mixed with 0.02 parts by weight of paraffin wax contains the mass and thereby coated with solid paraffin wax, which serves as a lubricant. The granulate is made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum mass is placed as a preformed element in a recess of a hard zone time the chewing gum mass is placed as a preformed element in a recess of a hard zone time the preiphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. Examples 7 to 11 As in Example 6, but using the plastic manufactured according to claim 1, wherein the chewing gum granulate is made flowable promptor of a preformed element in a recess of a hard zone time the		mass composed of the following constituents:	least one plastic zone comprising the chewing	
0.20 parts by weight of paraffin wax, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of ipecacuanha, 0.01 parts by weight of eucalyptus. Example 5 Similar to Example 2 except that 0.03 parts by weight of paraffin wax, by weight of narcotine are mixed into the plastic mass instead of 0.03 parts by weight of ipecacuanha and 0.03 parts by weight of eucalyptus. This tablet is again an antitussive. In this case, the narcotine incorporoted to have a retarded action continues to ease coughing for a long time. Example 6 Plastic mass consisting of: 1.75 parts by weight of chicle gum, 0.48 parts by weight of paraffin wax, 0.05 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.03 parts by weight of paraffin wax, 0.04 parts by weight of alum; is cooled to —10°C and granulated to a granulate size of 1 to 1.5 mm. The granulate is kept dry and heated to +18°C. The granulate is the chewing gum mass and the chewing gum mass and is pressed with the flowable non-plastic tablet mass and then pelletized. 5.4 process according to claim 2, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then pelletized. 5. A process according to claim 3, wherein the chewing gum granulate is mixed with the flowable non-plastic tablet mass and then pelletized. 5. A process according to claim 1, wherein a disc is punched out of a preformed strip comprising chewing gum mass and is pressed with the tablet mass to a tablet. 8. A process according to claim 1, wherein the tablet mass and which survounds the underside and at least part of the process according to claim 1, wherein the chewing gum mass and the said tablet mass and which survounds the underside and at least part of the process according to claim 1, wherein the tablet mass and which survounds the underside and at least part of the process according to claim 1, wherein the tablet mass and which survounds the underside and at least part of the process according to claim 1, wherein	25	1.00 parts by weight of chicle gum,		85

A process according to claim 1, wherein a disc is punched out of a preformed strip comprising chewing gum mass and is pressed with the tablet mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass is placed as a preformed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein a disc is punched out of a preformed strip comprising chewing gum mass and is pressed with the tablet mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein a disc is punched out of a preformed strip comprising chewing gum mass and is pressed with the tablet mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass and the said tablet. 8. A process according to claim 1, wherein the chewing gum mass and the claim 1, wherein the chewing gum mass and the claim 1, wherein the chewing gum mass and the claim 1, wherein the chewing gum mass and the claim 1, wherein the chewing gum mass and the claim 1, wherein the chewing gum mass and the claim 1, wher	4-	0.06 parts by weight of tolu balsam,	6. A process according to claim 1, wherein	.00
is cooled to -10°C and granulated to a granulate size of 1 to 1.5 mm. The granulate is kept dry and heated to +18°C. The granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to 30—50 microns and thereby coated with solid paraffin wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum mass is placed as a preformed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. Examples 7 to 11 As in Example 6, but using the plastic	45	0.03 parts by weight of Peru balsam and	the tablet mass and the chewing gum mass	
granulate size of 1 to 1.5 mm. The granulate is kept dry and heated to +18°C. The granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to 30—50 microns and thereby coated with solid paraffin wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum mass is placed as a preformed strip comprising chewing gum mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass is placed as a preformed strip comprising chewing gum mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass is placed as a preformed strip comprising chewing gum mass to a tablet. 8. A process according to claim 1, wherein the chewing gum mass and the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein the chewing gum mass and the said tablet mass being pressed to a tablet.		is cooled to -10° C and granulated to a		
so granulate is then mixed with 0.02 parts by weight of paraffin wax, comminuted to 30—50 microns and thereby coated with solid paraffin wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum mass is placed as a preformed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. Examples 7 to 11 As in Example 6, but using the plastic manufactured according to claim 1, wherein			a disc is punched out of a preformed strip	110
weight of paraffin wax, comminuted to 30—50 microns and thereby coated with solid paraffin wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum portion of a multi-zone tablet. 8. A process according to claim 1, wherein the chewing gum mass is placed as a preformed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein the chewing gum mass is placed as a preformed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said tablet mass being gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein	50			
wax, which serves as a lubricant. The granulate made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum portion of a multi-zone tablet. Examples 7 to 11 Example 6, but using the plastic By the granulation formed element in a recess of a hard zone pressed from the tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein		weight of paraffin wax, comminuted to 30—50		
late made flowable by the paraffin wax coating is pelletizable at +18°C and is introduced into a mould and pelletized with the chewing gum portion of a multi-zone tablet. Examples 7 to 11 As in Example 6, but using the plastic By the paraffin wax coating to tablet mass and which surrounds the underside and at least part of the periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein		microns and increby coated with solid paraffin- way, which serves as a lubricant. The granu-		115
into a mould and pelletized with the chewing gum portion of a multi-zone tablet. Examples 7 to 11 As in Example 6, but using the plastic periphery of the said element, the said chewing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein		late made flowable by the paraffin wax coat-		113
gum portion of a multi-zone tablet. Examples 7 to 11 As in Example 6, but using the plastic ing gum mass and the said tablet mass being pressed to a tablet. 9. A pharmaceutical multi-zone tablet, manufactured according to claim 1, wherein	55

plastic tablet mass, wherein at least one zone is plastic and comprises plastic chewing gum mass and wherein at least one of these masses contains a pharmaceutical active ingredient.

10. A table according to claim 9, wherein all the zones are layers extending over the entire tabler cross-section and wherein at least two layers are hard and comprises the tablet mass, between which a plastic layer formed from the chewing gum mass is provided.

11. A tablet according to claim 9, wherein a hard covering layer extending over the entire tablet cross-section is provided on each of the tablet faces and wherein between the same is provided a plastic layer of the chewing gum mass extending over only part of the tablet cross-section and which is surrounded on all sides by compressed hard tablet mass.

12. A tablet according to claim 9, wherein 20 it comprises a compressed mixture of chewing gum granulate and flowable tablet mass.

13. A tablet comprising a layer of a non-

plastic pharmaceutically acceptable tablet mass and a layer of a chewable pharmaceutically acceptable mass, at least one of said masses containing a pharmaceutically active ingre-

14. A tablet as claimed in claim 13 wherein both of said masses contain the same or different pharmaceutically active ingredients whereby said ingredient(s) are released from the tablet at different rates.

15. A tablet as claimed in claim 9 and substantially as hereinbefore described.

16. A tabletting process as claimed in claim 1 and substantially as hereinbefore described.
